

Medication Management

Automatic Dispensing Carts

ADC - Tabletop, Half & Full Towers

The HS8 + Talon solution offers a feature-rich, cost-effective, low-risk option to a hospital wishing to transition from paper to electronic controlled drug management.

At its core, HS8 is a controlled drug management platform for the entire hospital. However, it can also assist with the management of medications that are not controlled drugs, providing an end-to-end solution for the management of all medications.

Modular, Flexible & Scalable

Hospitals are able to adjust their solution as needed based on locations' drug transaction volumes, storage capacity requirements, physical space availability and other operational requirements. The options also make it easy for a hospital to implement and adjust a controlled drug solution to fit into their budgets.

Regardless of the scale or configuration, all locations will remain integrated via the software, offering visibility across the entire inventory of controlled drugs and others if required.

Humanscale T7 Cart

The MedLink Mobile Technology Cart is a point-of-care solution that ensures safe, accurate medication administration. MedLink is specifically designed to reduce human error, keep patients safe, and create a closed-loop medication system. The integration of HS8 Software with the ADC and MedLink cart results in a significantly reduced risk of error during the administration process. Every event is recorded introducing a new level of accountability and visibility into the medication workflow.
